Experiment 7: Integrating a Zoho Creator Application with Another Zoho Service Using Connections and APIs

Aim

To integrate the Job Application Management application developed in Zoho Creator with another Zoho service using Connections and APIs to automate candidate data transfer and improve recruitment management.

Objective

- To understand how to create and configure Connections in Zoho Creator for secure authentication.
- To learn how to use Deluge scripts and API requests to communicate with other Zoho services.
- To automate candidate data transfer when a new job application is submitted.
- To reduce manual data entry and improve recruitment data management.

Prerequisites and Tools Required

- Zoho Creator account.
- Job Application Management application.
- Job Application Form (Job_Application_Form).
- Zoho Recruit or Zoho CRM account for external integration.
- Zoho Creator Connections and Deluge scripting.
- Candidate fields such as:
    - Candidate Name
    - Email Address
    - Contact Number
    - Department Applied For
    - Employment Type

- Current Address
- Resume, if available

Step-by-Step Implementation Procedure

Step 1: Setting Up the Connection in Zoho Creator

1. Open the Job Application Management application.
2. Navigate to the Connections section in the application settings or developer tools.
3. Select the option to create a new connection.
4. Choose the required Zoho service, such as Zoho Recruit or Zoho CRM.
5. Provide an appropriate connection name, such as zoho_recruit_connection.
6. Select the permissions required to create candidate records.
7. Authorize the connection and save it.

Note: The available connection options and permission scopes depend on the selected service and your Zoho account.

Step 2: Identifying the Target API Endpoint

For integration with Zoho Recruit, the candidate creation API can be used.

- HTTP Method: POST
- Endpoint: https://www.zohoapis.com/recruit/v2/Candidates
- Purpose: Creates a candidate record in Zoho Recruit.

The API domain may differ depending on your Zoho data center. The request must follow Zoho Recruit's required field format and API documentation.

Step 3: Configuring the Form Workflow

1. Open the Workflow section in Zoho Creator.
2. Create a new Form Workflow.
3. Select Job_Application_Form.

4. Choose the On Add trigger and the appropriate success or execution action.

5. Add a Deluge script to prepare the candidate details and send them through the authorized connection.

6. Save the workflow and configure the required API request.

Step 4: Mapping Candidate Fields

Map the fields from your Job Application Form to the corresponding fields in the external service.

Job Application Management	Target Service Field
Candidate Name	Candidate Name
Email Address	Email
Contact Number	Phone
Department Applied For	Department or relevant job field
Employment Type	Employment Type, if supported
Current Address	Address
Resume	Resume attachment, if supported by the API

The exact field names must match the destination service's API requirements.

Step 5: Testing the Integration

1. Save and enable the configured workflow.

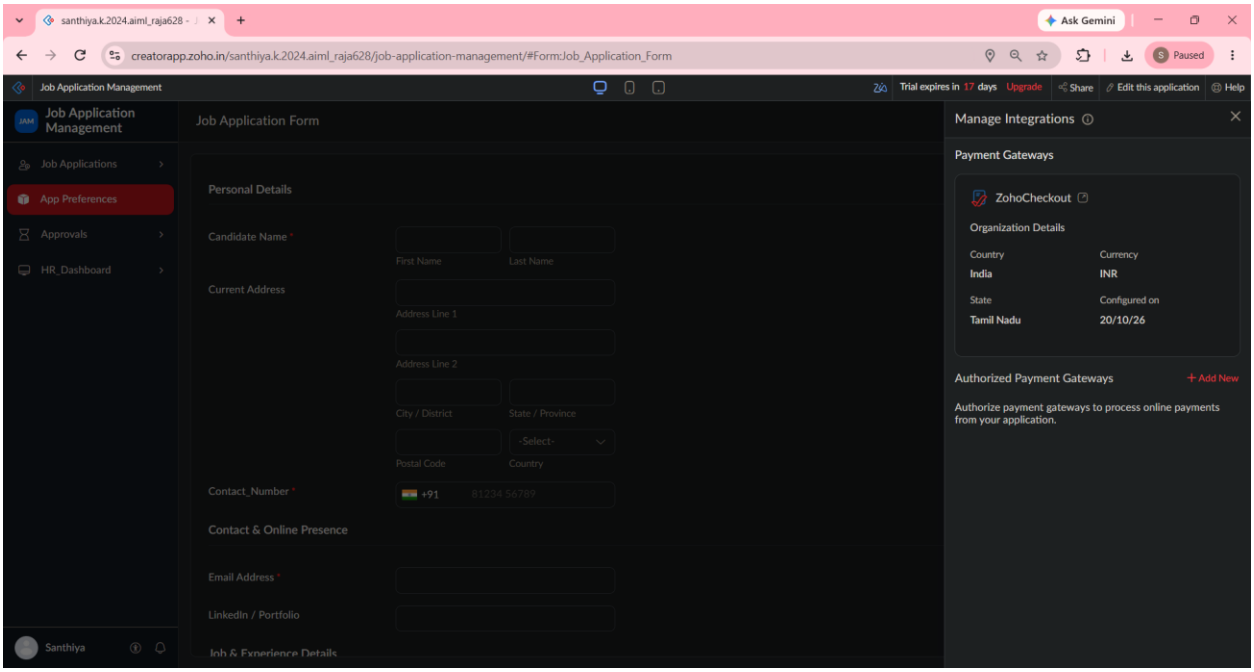

2. Submit a test record through Job_Application_Form.

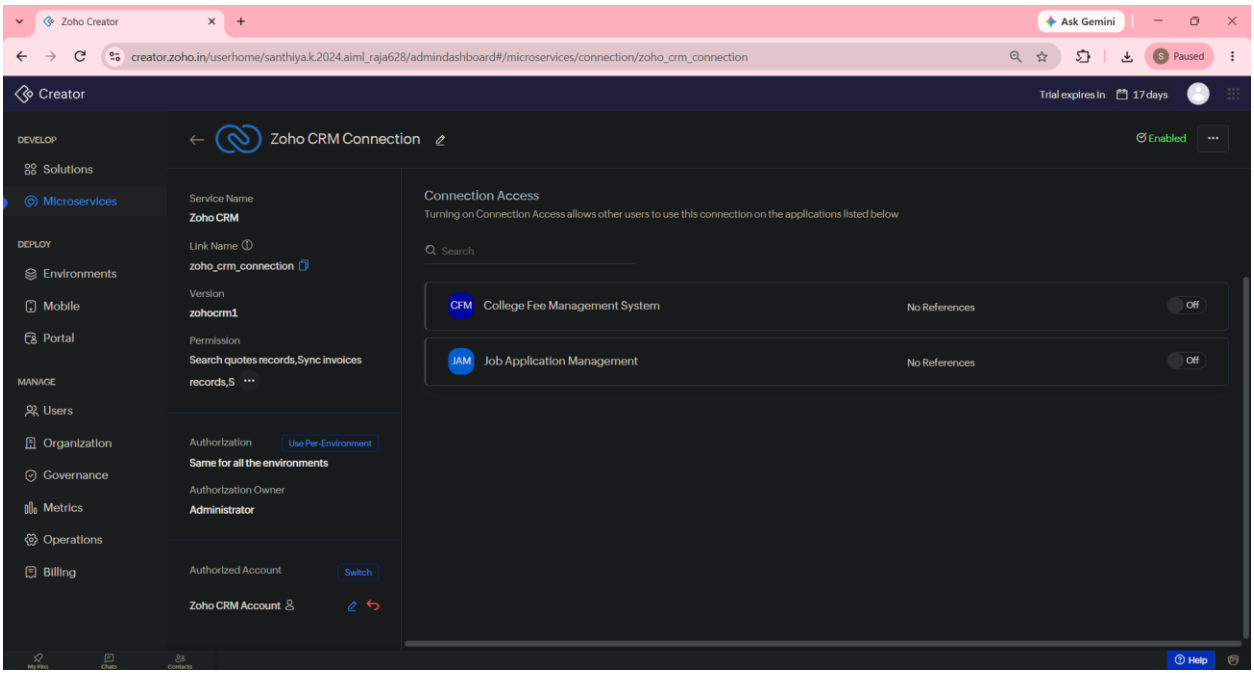

3. Verify whether the workflow executes successfully.

4. Check the destination Zoho service for the created candidate record.

5. Review any API error messages and correct field mappings or permissions if necessary.

Screenshot

Result

Thus, the integration procedure between the Job Application Management application in Zoho Creator and another Zoho service was documented using Connections, APIs, and Deluge workflows. This integration can automate candidate data transfer, reduce manual entry, and improve recruitment data management when successfully configured and tested.
