Experiment 8: Configuring User Management and Role-Based Access Control (RBAC)

Aim

To configure user management, assign roles, and implement Role-Based Access Control (RBAC) in the Job Application Management application using Zoho Creator to protect candidate information and control access to forms, reports, and application features.

Objective

- To understand user management and role configuration in Zoho Creator.
- To create and configure roles such as HR Administrator, Hiring Manager, and Interviewer.
- To assign appropriate permissions to forms, reports, and pages based on user roles.
- To restrict access to candidate information according to user responsibilities.
- To improve application security and maintain candidate data privacy.

Tools Required

- Zoho Creator account with administrator permissions.
- Job Application Management application.
- Forms: Job_Application_Form and other configured application forms.
- Reports: All_Job_Applications and Candidate_Application_Report.
- Users & Permissions settings in Zoho Creator.

Procedure

Step 1: Defining Roles in Zoho Creator

Create roles according to the responsibilities of users in the Job Application Management application.

1. Open the application in Zoho Creator.
2. Navigate to Users & Permissions.
3. Open the Roles section.
4. Create the following roles, if they are not already configured:
    - HR Administrator: Manages candidate records, job applications, reports, and recruitment settings.
    - Hiring Manager: Reviews candidate applications and updates recruitment status and interview details.
    - Interviewer: Views assigned candidates and submits interview feedback.

Step 2: Configuring Component-Level Permissions

Configure permissions to control which application components each role can access.

Component	**HR Administrator**	**Hiring Manager**	**Interviewer**
Job_Application_Form	Full access	View application details	Restricted access
All_Job_Applications	Full access	View and review records	View assigned candidates
Candidate_Application_Report	Full access	Update permitted	View permitted records

		fields	
Interview feedback form, if configured	Full access	View feedback	Add interview feedback
Recruitment Command Center	Full access	Access relevant information	Access assigned interview information

1. Navigate to Users & Permissions → Permissions.
2. Select the role to configure.
3. Assign the required access to forms, reports, and pages.
4. Save the permission settings.

Step 3: Implementing Record-Level Access Restrictions

Restrict candidate records so users can access only the information permitted by their roles.

1. Open the relevant candidate report in the application builder.
2. Configure report criteria or record-level permissions, where supported.
3. For candidate-specific access, use a condition that matches the logged-in user's email with the candidate's registered email.

Example Deluge-style condition:

Email_ID == zoho.loginuser

Here, Email_ID represents the candidate email field, and zoho.loginuser represents the logged-in user's email address.

Note: This condition is suitable only when the candidate's email matches the login email and the

report supports the required filtering. Apply appropriate permission rules separately for HR administrators and hiring managers.

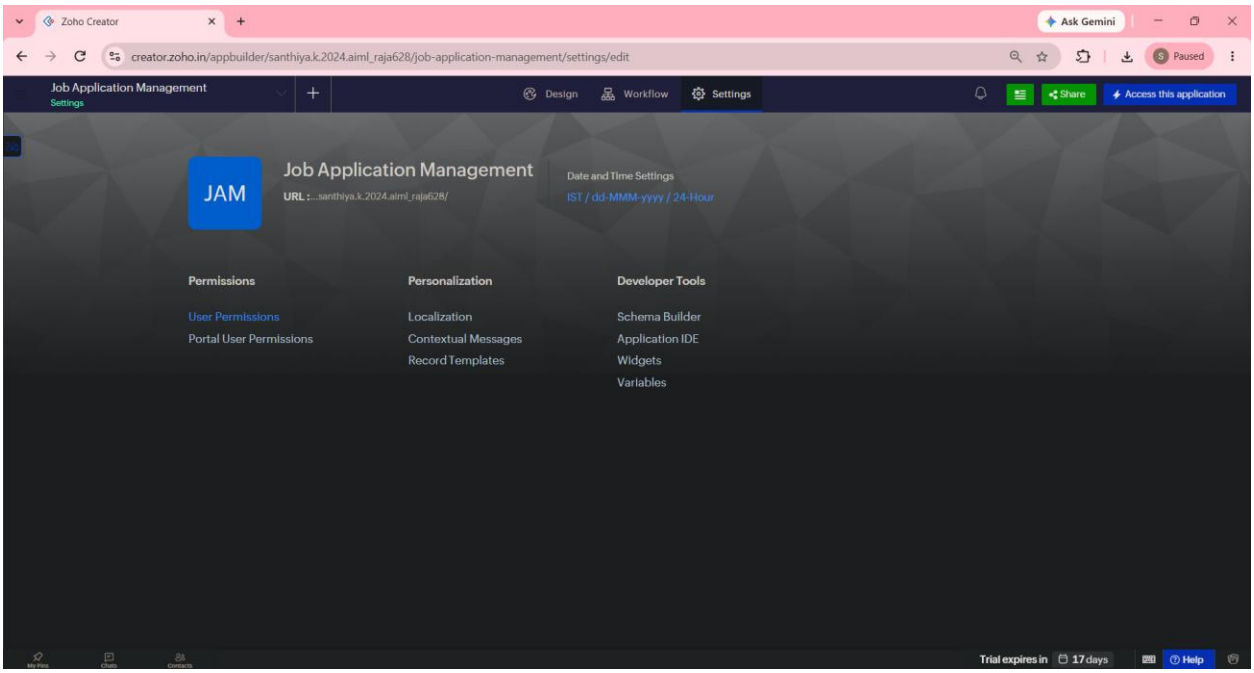

Step 4: Inviting Users and Assigning Roles

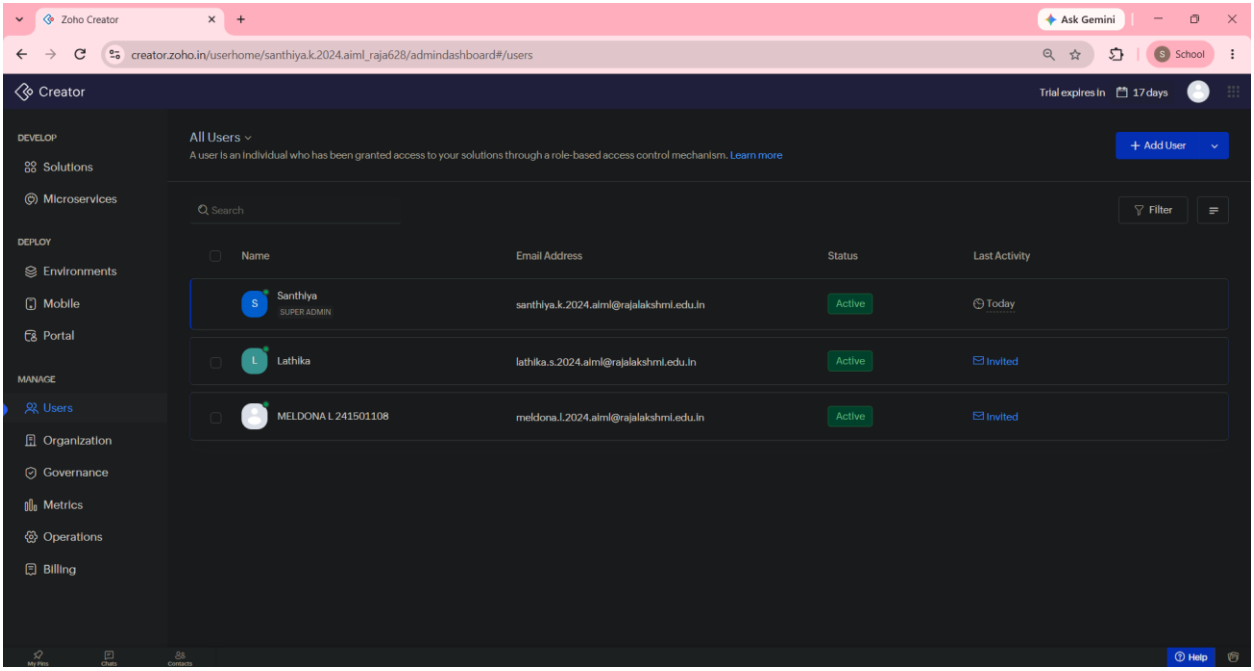

1. Open Users & Permissions → Users.
2. Select Invite User.
3. Enter the user's email address.
4. Assign the appropriate role, such as Hiring Manager or Interviewer.
5. Send the invitation.
6. Verify that the user has the expected access after accepting the invitation.

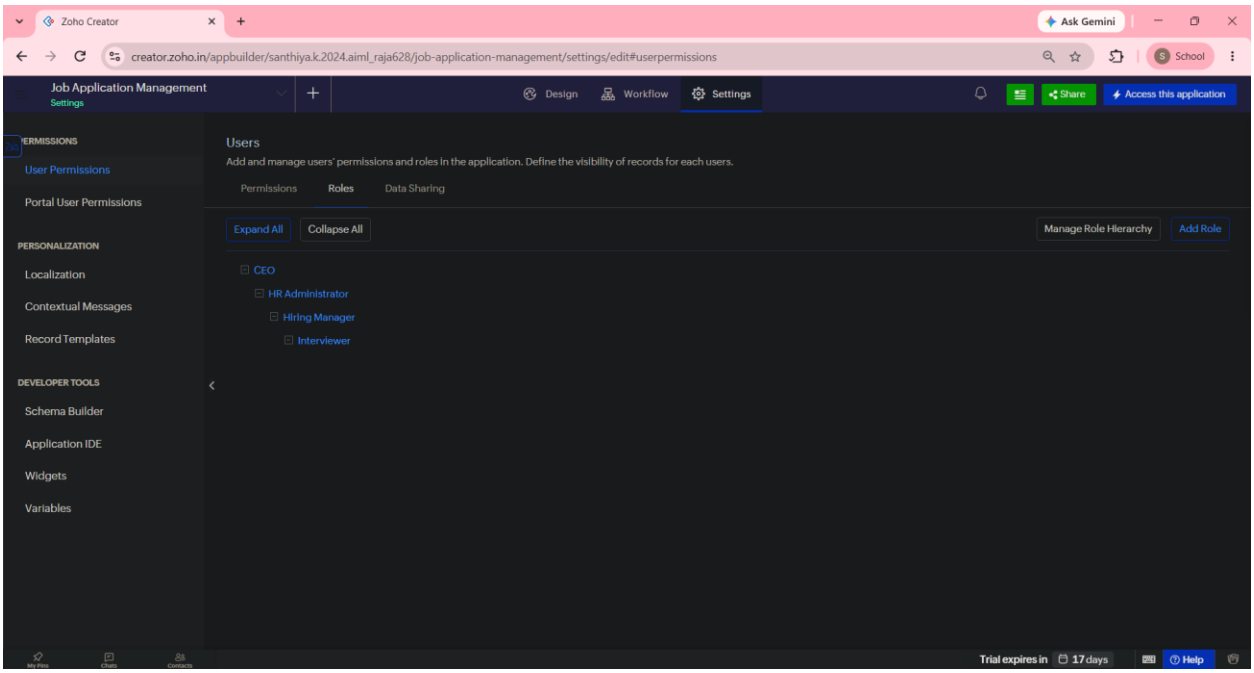

Step 5: Testing Role-Based Access

1. Log in using an authorized test account for each role.
2. Verify access to the permitted forms, reports, and pages.
3. Check that interviewers cannot access restricted administrative features.
4. Verify that hiring managers can review candidate applications.
5. Confirm that HR administrators can manage the recruitment records according to their assigned permissions.

Result

Thus, User Management and Role-Based Access Control (RBAC) were configured for the Job Application Management application in Zoho Creator. The role-based permission structure helps control access to candidate records, restrict administrative operations, and protect recruitment information according to user responsibilities.
