Implementing Security Features and Governance / Administration Practices in Zoho Creator

Aim

To configure and manage security features, role-based access control (RBAC), user permissions, and administrative practices in the Zoho Creator Job Application Management application to protect candidate information and ensure controlled access.

Objectives

- To create and manage user roles for HR Administrators, Hiring Managers, and Interviewers.
- To configure permissions for accessing forms, reports, and candidate records.
- To understand the importance of password security and multi-factor authentication.
- To explore IP restrictions and audit trails where these features are available.
- To improve data protection and maintain secure application access.

Overview

Security and governance are important for protecting candidate information in a recruitment application. Zoho Creator provides user management, role-based permissions, and administrative settings to help control access to application data.

1. Role-Based Access Control (RBAC)

Concept: RBAC assigns roles to users based on their responsibilities and controls their access to forms, reports, and records.

Application: The recruitment application uses the following roles:

- HR Administrator: Manages candidate applications, reports, and recruitment settings.
- Hiring Manager: Reviews applications and manages hiring decisions.

- Interviewer: Accesses relevant candidate details and interview information.

Benefit: Prevents unauthorized access and helps protect candidate information.

2. Security Policies

Concept: Security policies help protect user accounts through password requirements, multi-factor authentication (MFA), and session controls.

Application: Review the available account security settings and enable supported protections where permitted.

Benefit: Reduces the risk of unauthorized account access.

3. IP Restrictions

Concept: IP restrictions limit access to approved network addresses when supported by the organization's security settings.

Application: Check whether IP restrictions are available in the Zoho account or administration settings.

Benefit: Helps restrict access from unapproved networks.

4. Audit Trails

Concept: Audit trails record activities such as changes to records, user actions, and administrative events where logging is supported.

Application: Review available activity logs to monitor changes to candidate information and recruitment records.

Benefit: Improves accountability and helps identify errors or suspicious activity.

Procedure

Step 1: Setting Up Role-Based Access Control (RBAC)

1. Log in to Zoho Creator and open the Job Application Management application.
2. Navigate to Settings → User Permissions → Roles.
3. Create or verify the following roles:
    - HR Administrator
    - Hiring Manager

    - Interviewer
4. Open the permissions settings and review the access available for each role.
5. Configure access to the relevant forms and reports according to each user's responsibilities.
6. Assign the appropriate roles to the users who have been added to the application.
7. Verify that each user has the required permissions.

Step 2: Configuring User Security

1. Open the Zoho account or organization administration settings.
2. Locate the available security settings.
3. Review the password security requirements.
4. Check whether multi-factor authentication is available for the account.
5. Enable supported security features where permitted.
6. Review session settings if they are available.
7. Confirm that users can sign in securely.

Step 3: Checking IP Restrictions

1. Open the available organization or security administration settings.
2. Check whether an IP restriction or trusted network option is available.
3. If available, configure approved IP addresses with the organization administrator's guidance.
4. Save the settings if changes are made.
5. Verify the configuration without accidentally blocking authorized users.

Step 4: Monitoring Audit Trails and User Activities

1. Open the application or organization administration settings.
2. Look for available audit logs, activity logs, or record history features.
3. Review the available logs for changes to candidate records.

4. Check whether the activity details include the user and timestamp.
5. Verify that the configured user permissions are appropriate.
6. Record any issues and correct them where necessary.

Step 5: Testing Security and Permissions

1. Open the published or shared application.
2. Test access using the available authorized user accounts.
3. Verify that the HR Administrator can access the permitted recruitment management features.
4. Check that the Hiring Manager and Interviewer can access only the information allowed by their permissions.
5. Confirm that unauthorized users cannot access restricted forms or records.
6. Document the security settings that were successfully configured.

Result

Role-based access control and user permission settings were reviewed and configured for the recruitment application. Security settings, IP restriction options, and audit logging features were examined where available. The application security process demonstrated how user access can be controlled and candidate information protected through appropriate permissions and administrative practices.
